## Abstract:

Let  $R$  be a semiprime ring. Then we prove the following main result:

Let  $R$  be a 2-torsion free semiprime ring,  $t$  be a left centralizer and  $h$  be a reverse left centralizer of  $R$ , suppose that  $t^2 = h^2$ . Then  $t + h$  and  $t - h$  are orthogonal.

**Key Words:** semiprime ring , left centralizer , reverse left centralizer, orthogonal left centralizer and reverse left centralizer .

**Mathematic Subject classification :** 16 N 60, 42C05 , 33C45 .

---

## 1-Introduction :

A ring  $R$  is called semiprime if  $xRx = (0)$  implies  $x = 0$ , such that  $x \in R$  [3] .

Let  $R$  be a ring then  $R$  is called 2-torsion free if  $2x = 0$  implies  $x = 0$ , for all  $x \in R$  [3] .

A left (resp. right) centralizer of a ring  $R$  is an additive mapping  $t: R \longrightarrow R$  which satisfies the equation :  $t(xy) = t(x)y$  (resp.  $t(xy) = xt(y)$ ), for all  $x, y \in R$  .

$t$  is called a centralizer of  $R$  if it is both a left and a right centralizer [4] .

A left (resp. right) Jordan centralizer of a ring  $R$  is an additive mapping  $t: R \longrightarrow R$  which satisfies the equation  $t(x^2) = t(x)x$  (resp.  $t(x^2) = xt(x)$ ), for all  $x \in R$

$t$  is called a Jordan centralizer of  $R$  if it is both a left and a right Jordan centralizer [4] .

Also , Jarullah and Salih introduced the concepts of a higher reverse left (resp. right) centralizer and a Jordan higher reverse left (resp. right) centralizer on rings as follows :

Let  $t = (t_i)_{i \in \mathbb{N}}$  be a family of additive mappings of a ring  $R$  into itself .Then  $t$  is called a higher reverse left (resp. right) centralizer of  $R$  if for all  $x, y \in R$  and  $n \in \mathbb{N}$

$$t_n(xy) = \sum_{i=1}^n t_i(y) t_{i-1}(x) \text{ (resp. } t_n(xy) = \sum_{i=1}^n t_{i-1}(y) t_i(x) \text{)} \quad [3] .$$

Let  $t = (t_i)_{i \in \mathbb{N}}$  be a family of additive mappings of a ring  $R$  into itself. Then  $t$  is called a Jordan higher reverse left (resp. right) centralizer of  $R$ , if the following equation holds, for all  $x \in R$  and  $n \in \mathbb{N} : t_n(x^2) = \sum_{i=1}^n t_i(x) t_{i-1}(x)$  (resp.  $t_n(x^2) = \sum_{i=1}^n t_{i-1}(x) t_i(x)$ ) [3].

In this paper, we define and study the concept of orthogonal when  $t$  be a left centralizer and  $h$  be a reverse left centralizer of semiprime ring and we prove some of lemmas and theorems about orthogonally one of these theorems is :

Let  $R$  be a 2-torsion free semiprime ring,  $t$  be a left centralizer and  $h$  be a reverse left centralizer of  $R$ , such that  $t$  and  $h$  are commuting. Then  $t$  and  $h$  are orthogonal if and only if  $t(x)h(y) + h(x)t(y) = 0$ , for all  $x, y \in R$ .

In our work we need the following Lemmas :

**Lemma (1.1):** [2]

Let  $R$  be a 2-torsion free semiprime ring and  $x, y$  be elements of  $R$ , then the following conditions are equivalent :

(i)  $xry = 0$ , for all  $r \in R$

(ii)  $yrx = 0$ , for all  $r \in R$

(iii)  $xry + yrx = 0$ , for all  $r \in R$

If one of these conditions is fulfilled, then  $xy = yx = 0$ .

**Lemma (1.2):** [1]

Let  $R$  be a 2-torsion free semiprime ring and  $x, y$  be elements of  $R$  if  $xry + yrx = 0$ , for all  $r \in R$ , then  $xry = yrx = 0$ .

## 2-Orthogonal Left Centralizer and Reverse Left Centralizer on

### Semiprime Rings :

In this section we will introduce the definition of orthogonal when  $t$  be a left centralizer and  $h$  a reverse left centralizer of semiprime rings.

**Definition (2.1):**

Let  $t$  be a left centralizer and  $h$  be a reverse left centralizer of a ring  $R$ . Then  $t$  and  $h$  are called **orthogonal** if

$t(x)R h(y) = (0) = h(y)R t(x)$ , for all  $x, y \in R$ .

**Example (2.2):**

Let  $R$  be a ring of all  $2 \times 2$  matrices of integer numbers, such that

$$R = \left\{ \begin{pmatrix} x & 0 \\ 0 & y \end{pmatrix}; x, y \in \mathbb{Z} \right\}$$

Let  $t : R \rightarrow R$  be an additive mapping of a ring  $R$  into itself, such that

$$t \begin{pmatrix} x & 0 \\ 0 & y \end{pmatrix} = \begin{pmatrix} x & 0 \\ 0 & 0 \end{pmatrix}, \text{ for all } \begin{pmatrix} x & 0 \\ 0 & y \end{pmatrix} \in R$$

And  $h : R \rightarrow R$  be an additive mapping of a ring  $R$  into itself, such that

$$h \begin{pmatrix} x & 0 \\ 0 & y \end{pmatrix} = \begin{pmatrix} 0 & 0 \\ 0 & y \end{pmatrix}, \text{ for all } \begin{pmatrix} x & 0 \\ 0 & y \end{pmatrix} \in R.$$

$t$  is a left centralizer and  $h$  is a reverse left centralizer. Then  $t$  and  $h$  are orthogonal of  $R$ .

**Example (2.3):**

Let  $t$  is a left centralizer and  $h$  is a reverse left centralizer of a ring  $R$ , let  $S$  be a ring, such that  $S = R \oplus R = \{(x,y) ; x, y \in R\}$ , we define  $t^*$  and  $h^*$  on  $S$  by

$$t^*((x,y)) = (t(x), 0) \text{ and } h^*((x,y)) = (0, h(y)), \text{ for all } (x,y) \in S.$$

Then  $t^*$  and  $h^*$  are orthogonal of  $S$ .

**Lemma (2.4):**

Let  $R$  be a semiprime ring, suppose that  $t$  be a left centralizer and  $h$  be a reverse left centralizer of  $R$ , satisfy  $t(x) R h(x) = (0)$ , for all  $x \in R$ . Then  $t(x) R h(y) = (0)$ , for all  $x, y \in R$ .

**Proof:**

$$\text{Suppose that } t(x) z h(x) = 0, \text{ for all } x, y, z \in R \tag{1}$$

Replace  $x$  by  $x + y$  in (1), we have that

$$t(x + y) z h(x + y) = 0$$

$$t(x) z h(x) + t(x) z h(y) + t(y) z h(x) + t(y) z h(y) = 0$$

Therefore , by our assumption and Lemma (1.1) , we get

$$t(x) z h(x) = 0 , \text{ for all } x , y , z \in R$$

Thus,  $t(x) R h(y) = (0)$ , for all  $x , y \in R$

**Lemma (2.5):**

Let  $R$  be a 2-torsion free semiprime ring ,  $t$  be a left centralizer and  $h$  be a reverse left centralizer of  $R$  , such that  $t$  and  $h$  are commuting .Then  $t$  and  $h$  are orthogonal if and only if  $t(x) h(y) + h(x) t(y) = 0$ , for all  $x, y \in R$ .

**Proof :**

Suppose that  $t$  and  $h$  are orthogonal

T.P.  $t(x) h(y) + h(x) t(y) = 0$ , for all  $x , y \in R$

Since  $t$  and  $h$  are orthogonal , we have that

$$t(x) z h(y) = 0 = h(x) z t(y) , \text{ for all } x , y , z \in R$$

Therefore ,by Lemma (1.1) , we get the require result .

**Conversely** , Suppose that  $t(x) h(y) + h(x) t(y) = 0$  , for all  $x , y \in R$

T.P.  $t$  and  $h$  are orthogonal

By our assumption , we have that

$$t(x) h(y) + h(x) t(y) = 0 , \text{ for all } x , y \in R$$

Left multiply by  $z$  , we have that

$$z t(x) h(y) + z h(x) t(y) = 0$$

Since  $t$  and  $h$  are commuting , we have that

$$t(x) z h(y) + h(x) z t(y) = 0 , \text{ for all } z \in R$$

By Lemma (1.2) , we have that

$$\text{Thus , } t(x) z h(y) = 0 = h(x) z t(y) , \text{ for all } x , y , z \in R$$

Hence ,  $t$  and  $h$  are orthogonal

**Theorem (2.6):**

Let  $R$  be a 2-torsion free semiprime ring ,  $t$  be a left centralizer and  $h$  be a reverse left centralizer of  $R$  , where  $t$  and  $h$  are commuting . Then the following conditions are equivalent :

(i)  $t$  and  $h$  are orthogonal

(ii)  $th = 0$

(iii)  $ht = 0$

(iv)  $th + ht = 0$

**Proof:** (i)  $\Leftrightarrow$  (ii)

Suppose that  $t$  and  $h$  are orthogonal

$$t(x) z h(y) = 0 = h(y) z t(x) , \text{ for all } x , y , z \in R$$

T.P.  $th = 0$

By our assumption , we have that

$$h(y) z t(x) = 0$$

Replace  $x$  by  $h(y)$  , we have that

$$h(y) z t(h(y)) = 0$$

$$t(h(y)) z t(h(y)) = 0$$

$$t(h(y)) z t(h(y)) = 0$$

Since  $R$  is a semiprime ring , we have that

$$t(h(y)) = 0 , \text{ for all } y \in R \Rightarrow th = 0$$

**Conversely**, suppose that  $th = 0$

T.P.  $t$  and  $h$  are orthogonal

$$h(t(xy)) = 0$$

$$h(t(x) y) = 0$$

$$h(y) t(x) = 0 , \text{ for all } x , y \in R$$

Since  $t$  and  $h$  are commuting , we have

$$t(x) h(y) = 0 , \text{ for all } x , y \in R$$

Replace  $x$  by  $xz$  , we have that

$$t(xz) h(y) = 0$$

$$t(x) z h(y) = 0 , \text{ for all } x , y , z \in R \quad \dots(1)$$

Since  $t$  and  $h$  are commuting , we have

$$h(y) z t(x) = 0 , \text{ for all } x , y \in R \quad \dots(2)$$

Hence  $t$  and  $h$  are orthogonal

**Proof:** (i)  $\Leftrightarrow$  (iii)

By the same way in (i)  $\Leftrightarrow$  (ii) , we get (i)  $\Leftrightarrow$  (iii) .

**Proof:** (i)  $\Leftrightarrow$  (iv)

Suppose that  $t$  and  $h$  are orthogonal

T.P.  $th + ht = 0$

By (ii) and (iii) , we get the require result

**Conversely** , suppose that  $th + ht = 0$

T.P.  $t$  and  $h$  are orthogonal

$$(th + ht)(yx) = 0$$

$$t(h(yx)) + h(t(yx)) = 0$$

$$t(h(x)y) + h(t(y)x) = 0$$

$$t(h(x))y + h(x)t(y) = 0, \text{ for all } x, y \in R.$$

Replace  $t(h(x))$  by  $t(x)h(y)$  , we have that

$$t(x)h(y) + h(x)t(y) = 0, \text{ for all } x, y \in R$$

By Lemma (2.5) , we get the require result .

**Theorem(2.7):**

Let  $R$  be a 2-torsion free semiprime ring ,  $t$  be a left centralizer and  $h$  be a reverse left centralizer of  $R$  , suppose that  $t^2 = h^2$  . Then  $t + h$  and  $t - h$  are orthogonal .

**Proof :**

$$\begin{aligned} & ((t + h)(t - h) + (t - h)(t + h))(x) \\ &= (t(x) + h(x))(t(x) - h(x)) + (t(x) - h(x))(t(x) + h(x)) \\ &= t^2(x) - t(x)h(x) + h(x)t(x) - h^2(x) + t^2(x) + t(x)h(x) - h(x)t(x) - h^2(x) \\ &= 0 \end{aligned}$$

Therefore ,  $((t + h)(t - h) + (t - h)(t + h))(x) = 0$

By Theorem (2.6) (iv)  $\Rightarrow$ (i), we get the require result
