#### Abstract

In this paper we focused, to obtain some results on labeling of cycle graph, Cycle $C_{2 m}$ ( $m \geq 3$ ) and $C_{2 m+l}(m \geq 3)$ with parallel (path) $P_{4}$ chords. We have proved, every cycle $C_{2 m}(m \geq 3)$ and $C_{2 m+1}(m \geq 3)$ with parallel (path) $P_{4}$ chords is a vertex odd mean graph and vertex even mean graph, though it satisfied their labeling. And also graph is proved for Square Sum labeling and Square Difference Labeling on cycle $C_{2 m}$ ( $m \geq$ 3 ) and $C_{2 m+1}(m \geq 3)$ with parallel (path) $P_{4}$ chords. Keywords: Cycle with parallel (path) $P_{4}$ chords, Vertex odd mean labeling, Vertex even mean labeling, Square sum labeling, Square Difference Labeling

## Subject Classification: 05C78

## Introduction

Rosa introduced the labeling of graph in the year 1967[1]. A.Gallian has given survey for graph labeling in detail [3]. S.Somasundaram and R. Ponraj, found mean labeling and published results for some graphs[7]. Revathi [6] has established and proved the graphs for vertex even mean and vertex odd mean labeling. In [8], Ajitha, Arumugam \& Germina, established results for some graphs which admits square sum labeling. Square difference labeling is introduced and proved by J.Shiama [9]. We can able to study mean labeling for cycle graphs[4]. In [5] Graceful labeling is proposed for $C_{n}$ with parallel (path) $P_{k}$ chords.

Labelings on $\mathrm{C}_{\mathrm{n}}$ where ( $n \geq 6$ ) attains parallel Chords with path $\mathrm{P}_{3}$ proved by A.Uma Maheswari \& V.Srividya [2]. In [10], [11] further results are proposed for vertex even \& odd mean labeling, for new families of cycle with chord (parallel). In [12] certain labeling are proved for $C_{n}(n \geq 6)$ with parallel (path) $P_{3}$ as a Chord.

Throughout this paper, consider the cycle $C_{2 m}(m \geq 3)$ and $C_{2 m+1}(m \geq 3)$ with parallel $P_{4}$ chords. We have proved that the Cycle $C_{2 m}(m \geq 3)$ and $C_{2 m+1}(m \geq 3)$ with parallel $P_{4}$ chords admits labeling for Vertex Odd mean and Even mean. In addition, we also proved that these Graphs satisfies Square Sum and square difference labeling.

## Definition 1.1: [6]

A graph $G$, with vertices $(p)$ and edges ( $q$ ), if there exist function (injective) $f: V(G) \rightarrow\{1,3,5, \ldots, 2 q-1\}$ such that the induced function $f^{*}: E(G) \rightarrow N$ is given by $f^{*}(u v)=\frac{f(u)+f(v)}{2}$ where each edge $u v$ are distinct by the vertex odd mean labeling.

## Definition 1.2: [8]

A graph $G$ is called square sum graph, if it admits an 1-1 and onto labeling mapping $f: V(G) \rightarrow$ $\{0,1,2 \ldots, p-1\}$ given by the induced function $f^{*}=E(G) \rightarrow N$, defined by $f^{*}=[f(u)]^{2}+[f(v)]^{2}$ is injective for every edge $u v$ are distinct.

## Definition 1.3: [6]

A graph $G$, with vertices $(p)$ and edges $(q)$, if there exist an injective function $f: V(G) \rightarrow\{2,4,6, \ldots$ $2 q\}$ such that the induced mapping $f^{*}: E(G) \rightarrow N$ is given by $f^{*}(u v)=\frac{f(u)+f(v)}{2}$ are where all edges $u v$ are distinct is said to be vertex even mean graph by its labeling.

## Definition 1.4: [9]

A graph G , is called square difference graph, if it admits labeling with an 1-1 and onto mapping $f$ : $V(G) \rightarrow\{0,1,2, \ldots, p-1\}$ given by the induced function $f *: \mathrm{E}(\mathrm{G}) \rightarrow \mathrm{N}$, defined by $f *(u v)=\mid[f *(u)]^{2}-[f$ $*(v)]^{2} \mid$ is injective for every edge $u v$ are distinct.

## Definition 1.5: [5]

Cycle with parallel $P_{4}$ chords is obtained from the graph, $C_{n}: u_{0} u_{1} u_{2} \ldots \ldots . u_{n-1} u_{0}$ by attaching disjoint paths $P_{4}$ 's between two vertices $u_{1} u_{n-1}, u_{2} u_{n-2}, \ldots u_{\alpha} u_{\beta}$ of $C_{n}$ where $\alpha=\left\lfloor\frac{n}{2}\right\rfloor-1$,

$$
\beta=\left\lfloor\frac{n}{2}\right\rfloor+2 \text { (or) } \beta=\left\lfloor\frac{n}{2}\right\rfloor+1,
$$ when $n$ is odd \& even as shown in Fig. 1a and 1b.

In this paper, $\mathrm{C}_{2 m}(m \geq 3)$ has $4 m-2$ vertices and $5 m-3$ edges and for $\mathrm{C}_{2 m+1}(m \geq 3)$, has $4 m-1$ vertices and $5 m-2$ edges.

## II. Main Results

Theorem 1: For $m \geq 3$ every cycle $C_{2 m}$ with (path) $P_{4}$ which are parallel chords admits vertex even mean labeling.
Proof: Consider the graph G, $C_{2 m}(m \geq 3)$ with parallel $P_{4}$ chords. Let $v_{0}, v_{1}, v_{2}, \ldots, v_{4 m-3}$ are the vertices of Graph. Labeling of vertex are $f: V(G) \rightarrow\{2,4,6, \ldots 2(5 m-3)\}$,

$$
\begin{aligned}
& f\left(v_{4 j-4}\right)=2(4 j-3) ; 1 \leq j \leq m \\
& f\left(v_{4 j-3}\right)=4(2 j-1) ; 1 \leq j \leq m \\
& f\left(v_{4 j-2}\right)=8 j-2 ; 1 \leq j \leq m-1 \\
& f\left(v_{4 j-1}\right)=8 j \quad ; 1 \leq j \leq m-1
\end{aligned}
$$

The above labeling function of vertices ensures the labeling are unique.
Let $E(G)$, given by $E(G)=\bigcup_{i=1}^{7} E_{i}$ where,

$$
\begin{aligned}
& E_{1}=\left\{\left(v_{4 j-4} v_{4 j-3}\right) ; \mathrm{j}=1\right\} \\
& E_{2}=\left\{\left(v_{4 j-4} v_{4 j}\right) ; 1 \leq j \leq m-1\right\} \\
& E_{3}=\left\{\left(v_{4 j-3} v_{4 j+1}\right) ; 1 \leq j \leq m-1\right\} \\
& E_{4}=\left\{\left(v_{4 j-3} v_{4 j-2}\right) ; 1 \leq j \leq m-1\right\} \\
& E_{5}=\left\{\left(v_{4 j-1} v_{4 j}\right) ; 1 \leq j \leq m-1\right\} \\
& E_{6}=\left\{\left(v_{4 j-2} v_{4 j-1}\right) ; 1 \leq j \leq m-1\right\} \\
& E_{7}=\left\{\left(v_{4 m-4} v_{4 m-3}\right)\right\}
\end{aligned}
$$

Induced function $f^{*}: E(G) \rightarrow N$, is defined as,

$$
\begin{aligned}
& f^{*}\left(v_{4 j-4} v_{4 j-3}\right)=8 j-5 ; j=1 \\
& f^{*}\left(v_{4 j-4} v_{4 j}\right)=2(4 j-1) ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 j-3} v_{4 j+1}\right)=8 j ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 j-3} v_{4 j-2}\right)=8 j-3 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 j-1} v_{4 j}\right)=8 j+1 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 j-2} v_{4 j-1}\right)=8 j-1 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 m-4} v_{4 m-3}\right)=8 m-5
\end{aligned}
$$

It is clear that, labeling of the edges are distinct by the induced function. Hence, $\mathrm{C}_{2 m}(m \geq 3)$ with path $P_{4}$ chords which are parallel is a vertex even mean graph.

Example 1: Vertex even mean labeling for $C_{8}$ with parallel $P_{4}$ chords, illustrated in Fig 2.

Fig. 2 Cycle $\mathrm{C}_{8}$ with parallel $\mathrm{P}_{4}$ chord
Theorem 2: For $m \geq 3$ every cycle $C_{2 m+1}$ with (path) $P_{4}$ which are parallel chords admits vertex even mean labeling.
Proof: Let the graph G, cycle $C_{2 m+1}(m \geq 3)$ with parallel $P_{4}$ chords. Let $v_{0}, v_{1}, v_{2}, \ldots, v_{4 \mathrm{~m}-2}$ are the vertices of $G$. Define the labeling for vertex $f: V(G) \rightarrow\{2,4,6, \ldots 2(5 m-2)\}$ as follows:

$$
\begin{aligned}
& f\left(v_{4 j-4}\right)=2(4 \mathrm{j}-3) ; 1 \leq j \leq m \\
& f\left(v_{4 j-3}\right)=4(2 \mathrm{j}-1) ; 1 \leq j \leq m \\
& f\left(v_{4 j-2}\right)=2(4 \mathrm{j}-1) ; 1 \leq j \leq m-1 \\
& f\left(v_{4 j-1}\right)=8 \mathrm{j} \quad ; 1 \leq j \leq m \\
& f\left(v_{4 \mathrm{~m}-2}\right)=8 \mathrm{~m}-2
\end{aligned}
$$

The above labeling function of vertices ensures the labeling are unique.
Let $\mathrm{E}(\mathrm{G})=\mathrm{U}_{i=1}^{7} \mathrm{E}_{\mathrm{i}}$ where,

$$
\begin{aligned}
& \mathrm{E}_{1}=\left\{\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}-3}\right) ; \mathrm{j}=1\right\} \\
& \mathrm{E}_{2}=\left\{\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{3}=\left\{\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}+1}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{4}=\left\{\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}-2}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{5}=\left\{\left(v_{4 \mathrm{j}-1} v_{4 \mathrm{j}}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{6}=\left\{\left(v_{4 \mathrm{j}-2} v_{4 \mathrm{j}-1}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{7}=\left\{\left(v_{4 \mathrm{~m}-4} v_{4 \mathrm{~m}-2}\right)\right\} \text { and } \mathrm{E}_{8}=\left\{\left(v_{4 \mathrm{~m}-3} v_{4 \mathrm{~m}-2}\right)\right\}
\end{aligned}
$$

Let us define the values of induced function $f^{*}: \mathrm{E}(\mathrm{G}) \rightarrow \mathrm{N}$, as follows to label the edges

$$
\begin{aligned}
& f^{*}\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}-3}\right)=8 \mathrm{j}-5 ; \mathrm{j}=1 \\
& f^{*}\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}}\right)=2(4 \mathrm{j}-1) ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}+1}\right)=8 \mathrm{j} ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}-2}\right)=8 \mathrm{j}-3 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-2} v_{4 \mathrm{j}-1}\right)=8 \mathrm{j}-1 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-1} v_{4 \mathrm{j}}\right)=8 \mathrm{j}+1 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{~m}-4} v_{4 \mathrm{~m}-2}\right)=4(2 \mathrm{~m}-1) \text { and } f^{*} *\left(v_{4 \mathrm{~m}-3} v_{4 \mathrm{~m}-2}\right)=8 \mathrm{~m}-3
\end{aligned}
$$

It is clear that, labeling of the edges are distinct by the induced function.
Example 2: Vertex even mean graph, $C_{9}$ with (path) $P_{4}$ as parallel chords, illustrated in Fig 3

Fig. 3 Cycle $\mathrm{C}_{9}$ with parallel $\mathrm{P}_{4}$ chord
Theorem 3: For $m \geq 3$ every cycle $C_{2 m}$ with (path) $P_{4}$ which are parallel chords admits vertex odd mean labeling.

Proof: Consider G, as $C_{2 m}(m \geq 3)$ with parallel (path) $P_{4}$ chords. Let $v_{0}, v_{1}, v_{2}, \ldots, v_{4 \mathrm{~m}-3}$ are the vertices of $G$. Labeling for vertices are defined by $f: V(G) \rightarrow\{1,3,5, \ldots 2(5 m-3)-1\}$,

$$
\begin{array}{ll}
f\left(v_{4 \mathrm{j}-4}\right)=8 \mathrm{j}-7 & ; 1 \leq j \leq m \\
f\left(v_{4 \mathrm{j}-3}\right)=8 \mathrm{j}-5 & ; 1 \leq j \leq m-1 \\
f\left(v_{4 \mathrm{j}-2}\right)=8 \mathrm{j}-3 & ; 1 \leq j \leq m-1 \\
f\left(v_{4 \mathrm{j}-1}\right)=8 \mathrm{j}-1 & ; 1 \leq j \leq m-1
\end{array}
$$

It implies that vertices are labeled and distinct.
Let $\mathrm{E}(\mathrm{G})=\mathrm{U}_{i=1}^{7} \mathrm{E}_{\mathrm{i}}$ where,

$$
\begin{aligned}
& \mathrm{E}_{1}=\left\{\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}-3}\right) ; \mathrm{j}=1\right\} \\
& \mathrm{E}_{2}=\left\{\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{3}=\left\{\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}+1}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{4}=\left\{\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}-2}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{5}=\left\{\left(v_{4 \mathrm{j}-2} v_{\mathrm{jj}-1}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{6}=\left\{\left(v_{4 \mathrm{j}-1} v_{4 \mathrm{j}}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{7}=\left\{\left(v_{4 \mathrm{~m}-4} v_{4 \mathrm{~m}-3}\right)\right.
\end{aligned}
$$

Defining the induced function $f^{*}: \mathrm{E}(\mathrm{G}) \rightarrow \mathrm{N}$, as follows

$$
\begin{aligned}
& f *\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}-3}\right)=2(4 \mathrm{j}-3) ; \mathrm{j}=1 \\
& f^{*}\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}}\right)=8 \mathrm{i}-3 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}+1}\right)=8 \mathrm{i}-1 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}-2}\right)=4(2 \mathrm{j}-1) ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-2} v_{4 \mathrm{j}-1}\right)=2(4 \mathrm{j}-1) ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-1} v_{4 \mathrm{j}}\right)=8 \mathrm{j} ; 1 \leq j \leq m-1 \\
& f^{*} *\left(v_{4 \mathrm{~m}-4} v_{4 \mathrm{~m}-3}\right)=8 \mathrm{~m}-6
\end{aligned}
$$

It is clear that, labeling of the edges are distinct by the induced function. Hence G, $C_{2 m}(m \geq 3)$ with parallel (path) $P_{4}$ as a chords is said to be vertex odd mean graph.

Example 3: Vertex odd mean graph, $C_{8}$ with parallel (path) $P_{4}$ chords is, illustrated in Fig. 4

Fig. 4 Cycle $\mathrm{C}_{8}$ with parallel $\mathrm{P}_{4}$ chord

## Theorem 4: For $m \geq 3$ every cycle $C_{2 m+1}$ with (path) $P_{4}$ which are parallel chords is admits vertex odd mean labeling.

Proof: Consider G, as $C_{2 m+1}(m \geq 3)$ with (path) $P_{4}$ chords as a parallel. Let $v_{0}, v_{1}, v_{2}, \ldots, v_{4 \mathrm{~m}-2}$ are vertices of $G$. where the vertex labeling $f: V(G) \rightarrow\{1,3,5, \ldots, 2(5 m-2)-1\}$ as follows:

$$
\begin{aligned}
& f\left(v_{4 \mathrm{j}-4}\right)=8 \mathrm{j}-7 \quad ; 1 \leq j \leq m \\
& f\left(v_{4 \mathrm{j}-3}\right)=8 \mathrm{j}-5 \quad ; 1 \leq j \leq m \\
& f\left(v_{4 \mathrm{j}-2}\right)=8 \mathrm{j}-3 \quad ; 1 \leq j \leq m-1 \\
& f\left(v_{4 \mathrm{j}-1}\right)=8 \mathrm{j}-1 \quad ; 1 \leq j \leq m-1 \\
& f\left(v_{4 \mathrm{~m}-2}\right)=8 \mathrm{~m}-3
\end{aligned}
$$

The vertices are distinctly labeled.
Let $\mathrm{E}(\mathrm{G})=\mathrm{U}_{i=1}^{8} \mathrm{E}_{\mathrm{i}}$ where,
$\mathrm{E}_{1}=\left\{\left(v_{4 j-4} v_{4 j-3}\right) ; \mathrm{j}=1\right\}$
$\mathrm{E}_{2}=\left\{\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}}\right) ; 1 \leq \mathrm{j} \leq \mathrm{m}-1\right\}$
$\mathrm{E}_{3}=\left\{\left(\nu_{4 \mathrm{j}-3} \mathrm{v}_{4 \mathrm{j}+1}\right) ; 1 \leq \mathrm{j} \leq \mathrm{m}-1\right\}$
$\mathrm{E}_{4}=\left\{\left(v_{4 \mathrm{j}-3} \mathrm{v}_{4 \mathrm{j}-2}\right) ; 1 \leq \mathrm{j} \leq \mathrm{m}-1\right\}$
$\mathrm{E}_{5}=\left\{\left(v_{4 \mathrm{j}-2} \mathrm{v}_{4 \mathrm{j}-1}\right) ; 1 \leq \mathrm{j} \leq \mathrm{m}-1\right\}$
$\mathrm{E}_{6}=\left\{\left(v_{4 \mathrm{j}-1} v_{4 \mathrm{j}}\right) ; 1 \leq \mathrm{j} \leq \mathrm{m}-1\right\}$
$\mathrm{E}_{7}=\left\{\left(v_{4 \mathrm{~m}-4} v_{4 \mathrm{~m}-2}\right)\right\} \&$

$$
\mathrm{E}_{8}=\left\{\left(v_{4 \mathrm{~m}-3} v_{4 \mathrm{~m}-2}\right)\right\}
$$

Defining the induced edges by the function $f^{*}: \mathrm{E}(\mathrm{G}) \rightarrow \mathrm{N}$, follows

$$
\begin{aligned}
& f *\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}-3}\right)=2(4 \mathrm{j}-3) ; \mathrm{j}=1 \\
& f^{*} *\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}}\right)=8 \mathrm{j}-3 ; 1 \leq \mathrm{j} \leq \mathrm{m}-1 \\
& f^{*}\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}+1}\right)=8 \mathrm{j}-1 ; 1 \leq \mathrm{j} \leq \mathrm{m}-1 \\
& f^{*}\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}-2}\right)=2(4 \mathrm{j}-2) ; 1 \leq \mathrm{j} \leq \mathrm{m}-1 \\
& f^{*}\left(v_{4 \mathrm{j}-2} v_{4 \mathrm{j}-1}\right)=2(4 \mathrm{j}-1) ; 1 \leq \mathrm{j} \leq \mathrm{m}-1 \\
& f^{*}\left(v_{4 \mathrm{j}-1} v_{4 \mathrm{j}}\right)=8 \mathrm{j} ; 1 \leq \mathrm{j} \leq \mathrm{m}-1 \\
& f^{*} *\left(v_{4 \mathrm{~m}-4} v_{4 \mathrm{~m}-2}\right)=8 \mathrm{~m}-5 \text { and } \\
& f^{*}\left(v_{4 \mathrm{~m}-3} v_{4 \mathrm{~m}-2}\right)=8 \mathrm{~m}-4
\end{aligned}
$$

It is clear that, labeling of the edges are distinct by the induced function. Hence $\mathrm{G}, C_{2 m+1}$ with (path) $P_{4}$ which are parallel chords is a vertex odd mean graph.

Example 4: $C_{9}$ with (path) $P_{4}$ chords as parallel is vertex odd mean graph, illustrated in Fig.5.

Fig. 5 Cycle $\mathrm{C}_{9}$ with parallel $\mathrm{P}_{4}$ chords
Theorem 5: For $m \geq 3$ every cycle $C_{2 m}$ with (path) $P_{4}$ chords which are parallel is admits square sum labeling.
Proof: Consider G, $C_{2 m}(m \geq 3)$ with parallel (path) $P_{4}$ chords. Let $v_{0}, v_{1}, v_{2}, \ldots, v_{4 m-3}$ are vertices of $G$. Labeling of vertex is defined as $f: V(G) \rightarrow\{0,1,2, \ldots, 4 \mathrm{~m}-3\}$

$$
f\left(\mathrm{v}_{\mathrm{j}}\right)=j ; 0 \leq j \leq 4 m-3
$$

Hence, vertices are labeled with above function are distinct.
Let $\mathrm{E}(\mathrm{G})$ be the edge set given for $\mathrm{C}_{2 \mathrm{n}}, \mathrm{E}(\mathrm{G})=\mathrm{U}_{i=1}^{7} \mathrm{E}_{\mathrm{i}}$ where,

$$
\begin{aligned}
& \mathrm{E}_{1}=\left\{\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}-3}\right) ; j=1\right\} \\
& \mathrm{E}_{2}=\left\{\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}+1}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{3}=\left\{\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{4}=\left\{\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}-2}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{5}=\left\{\left(v_{4 \mathrm{j}-2} v_{4 \mathrm{j}-1}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{6}=\left\{\left(v_{4 \mathrm{j}-1} v_{4 \mathrm{j}}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{7}=\left\{\left(v_{4 \mathrm{~m}-4} v_{4 \mathrm{~m}-3}\right)\right\}
\end{aligned}
$$

Defining the induced edge function $f^{*}: \mathrm{E}(\mathrm{G}) \rightarrow \mathrm{N}$,

$$
\begin{aligned}
& f *\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}-3}\right)=32 \mathrm{j}^{2}-56 \mathrm{j}+25 ; \mathrm{j}=1 \\
& f^{*}\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}+1}\right)=32 \mathrm{i}^{2}-16 \mathrm{j}+10 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}}\right)=32 \mathrm{j}^{2}-32 \mathrm{j}+16 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}-2}\right)=32 \mathrm{j}^{2}-40 \mathrm{j}+13 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-2} v_{4 \mathrm{j}-1}\right)=32 \mathrm{j}^{2}-24 \mathrm{j}+5 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-1} v_{4 \mathrm{j}}\right)=32 \mathrm{j}^{2}-8 \mathrm{j}+1 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{~m}-4} v_{4 \mathrm{~m}-3}\right)=32 \mathrm{~m}^{2}-56 \mathrm{~m}+25
\end{aligned}
$$

It is clear that, labeling of the edges are distinct by the induced function. Hence, Graph G $C_{2 m}(m \geq 3)$ with parallel (path) $P_{4}$ chords is a square sum graph.

Example 5: A cycle $C_{8}$ with parallel $P_{4}$ chords is square sum graph, illustrated in Fig. 6

Fig. 6 Cycle $\mathrm{C}_{8}$ with parallel $\mathrm{P}_{4}$ chords
Theorem 6: For $m \geq 3$ every cycle $C_{2 m+1}$ with (path) $P_{4}$ which are Parallel chords is admits square sum labeling.
Proof: Consider G, as $C_{2 m+1}(m \geq 3)$ with (path) $P_{4}$ chords as a parallel. Let $v_{0}, v_{1}, v_{2}, \ldots, v_{4 \mathrm{~m}-2}$ are vertices of $G$. Labeling of vertex are defined by $f: V(G) \rightarrow\{0,1,2, \ldots, 4 \mathrm{~m}-2\}$,

$$
f\left(\mathrm{v}_{\mathrm{j}}\right)=\mathrm{j} \quad ; 0 \leq \mathrm{j} \leq 4 \mathrm{~m}-2
$$

The above labeling function will label all vertices are distinct.
Let $E(G)$ be the edge set given for $C_{2 n+1}, E(G)=U_{i=1}^{8} E_{i}$ where,

$$
\begin{aligned}
& \mathrm{E}_{1}=\left\{\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}-3}\right) ; \mathrm{j}=1\right\} \\
& \mathrm{E}_{2}=\left\{\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}+1}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{3}=\left\{\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{4}=\left\{\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}-2}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{5}=\left\{\left(v_{4 \mathrm{j}-2} v_{4 \mathrm{j}-1}\right) ; 1 \leq j \leq m-1\right\} \\
& \mathrm{E}_{6}=\left\{\left(v_{4 \mathrm{j}-1} v_{4 \mathrm{j}}\right) ; 1 \leq j \leq m \leq 1 \leq\right. \\
& \mathrm{E}_{7}=\left\{\left(v_{4 \mathrm{~m}-4} v_{4 \mathrm{~m}-2}\right)\right\} \text { and } \\
& \mathrm{E}_{8}=\left\{\left(v_{4 \mathrm{~m}-3} v_{4 \mathrm{~m}-2}\right)\right\},
\end{aligned}
$$

Defining the induced edges by the function $f^{*}: \mathrm{E}(\mathrm{G}) \rightarrow \mathrm{N}$,

$$
\begin{aligned}
& f *\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}-3}\right)=32 \mathrm{j}^{2}-56 \mathrm{j}+25 ; \mathrm{j}=1 \\
& f *\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}+1}\right)=32 \mathrm{j}^{2}-16 \mathrm{j}+10 ; 1 \leq j \leq m-1 \\
& f *\left(v_{4 \mathrm{j}-4} v_{4 j}\right)=32 \mathrm{j}^{2}-32 \mathrm{j}+16 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}-2}\right)=32 \mathrm{j}^{2}-40 \mathrm{j}+13 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-2} v_{4 \mathrm{j}-1}\right)=32 \mathrm{j}^{2}-24 \mathrm{j}+5 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-1} 1 v_{4 \mathrm{j}}\right)=32 \mathrm{j}^{2}-8 \mathrm{j}+1 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{~m}-4} v_{4 \mathrm{~m}-2}\right)=32 \mathrm{~m}^{2}-48 \mathrm{~m}+20 \text { and } \\
& f *\left(v_{4 \mathrm{~m}-3} v_{4 \mathrm{~m}-2}\right)=32 \mathrm{~m}^{2}-40 \mathrm{~m}+13
\end{aligned}
$$

It is clear that, labeling of the edges are distinct by the induced function. Therefore, the Graph G, $C_{2 m+1}(m \geq 3)$ with parallel $P_{4}$ chords is a square sum graph.

Example 6: A Cycle $\mathrm{C}_{9}$ with parallel $\mathrm{P}_{4}$ chords is square sum graph, illustrated in Fig 7.

Fig. 7 Cycle $\mathrm{C}_{9}$ with parallel $\mathrm{P}_{4}$ chords

Theorem 7: For $m \geq 3$ every cycle $C_{2 m}$ with (path) $P_{4}$ which are parallel chords is admits square difference labeling.
Proof: Consider G, has $v_{0}, v_{1}, v_{2}, \ldots, v_{4 \mathrm{~m}-3}$ be the vertices. Labeling of vertex is defined by $f: V(G) \rightarrow\{0,1,2$, ..., 4m-3\},

$$
f\left(\mathrm{v}_{\mathrm{j}}\right)=\mathrm{j} \quad ; 0 \leq \mathrm{j} \leq 4 \mathrm{~m}-3
$$

Hence vertices labeled are distinct.
Let $\mathrm{E}(\mathrm{G})$ be the edge set given for $\mathrm{C}_{2 \mathrm{~m}}, \mathrm{E}(\mathrm{G})=\mathrm{U}_{i=1}^{7} \mathrm{E}_{\mathrm{i}}$ where,
$\mathrm{E}_{1}=\left\{\left(v_{4 j-4} v_{4 j-3}\right) ; \mathrm{j}=1\right\}$
$\mathrm{E}_{2}=\left\{\left(v_{4 i-3} v_{4 j+1}\right) ; 1 \leq j \leq m-1\right\}$
$\mathrm{E}_{3}=\left\{\left(v_{4 \mathrm{j}-4} v_{4 j}\right) ; 1 \leq j \leq m-1\right\}$
$\mathrm{E}_{4}=\left\{\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}-2}\right) ; 1 \leq j \leq m-1\right\}$
$\mathrm{E}_{5}=\left\{\left(v_{4 \mathrm{j}-2} v_{4 \mathrm{j}-1}\right) ; 1 \leq j \leq m-1\right\}$
$\mathrm{E}_{6}=\left\{\left(v_{4 \mathrm{j}-1} v_{4 \mathrm{j}}\right) ; 1 \leq j \leq m-1\right\}$
$\mathrm{E}_{7}=\left\{\left(\nu_{4 \mathrm{~m}-4} v_{4 \mathrm{~m}-3}\right)\right\}$ these edges set $\mathrm{C}_{2 \mathrm{~m}}(\mathrm{~m} \geq 3)$.
Defining the induced edges by the function $f^{*}: \mathrm{E}(\mathrm{G}) \rightarrow \mathrm{N}$,

$$
\begin{aligned}
& f *\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}-3}\right)=32 \mathrm{j}^{2}-56 \mathrm{j}+25 ; \mathrm{j}=1 \\
& f^{*}\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}+1}\right)=8(4 \mathrm{jj}-1) ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}}\right)=8(4 \mathrm{j}-2) ; 1 \leq j \leq m-1 \\
& f *\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}-2}\right)=8 \mathrm{j}-5 ; 1 \leq j \leq m-1 \\
& f *\left(v_{4 \mathrm{j}-2} v_{4 \mathrm{j}-1}\right)=8 \mathrm{j}-3 ; 1 \leq j \leq m-1 \\
& f *\left(v_{4 \mathrm{j}-1} v_{4 \mathrm{j}}\right)=8 \mathrm{j}-1 ; 1 \leq j \leq m-1 \\
& f *\left(v_{4 \mathrm{~m}-4} v_{4 \mathrm{~m}-3}\right)=8 \mathrm{~m}-7
\end{aligned}
$$

It is clear that, labeling of the edges are distinct by the induced function. Therefore, the Graph G, $C_{2 m}$ ( $m \geq 3$ ) with (path) $P_{4}$ chords with parallel is a square Difference graph.

Example 7: $\mathrm{C}_{8}$ with (path) $\mathrm{P}_{4}$ chords as a parallel is a square Difference graph, illustrated in Fig 8.

Fig. 8 Cycle $\mathrm{C}_{8}$ with parallel $\mathrm{P}_{4}$ chords
Theorem 8: For $m \geq 3$ every cycle $C_{2 m+1}$ with (path) $P_{4}$ which are parallel chords I admits square difference labeling.
Proof: Consider, G has $v_{0}, v_{1}, v_{2}, \ldots, v_{4 \mathrm{~m}-2}$ are the vertices of $G$. The vertex labeling is defined by $f: V(G) \rightarrow$ $\{0,1,2, \ldots, 4 \mathrm{~m}-2\}$,
$f\left(\mathrm{v}_{\mathrm{j}}\right)=\mathrm{j} ; 0 \leq j \leq 4 m-2$
Hence vertices are labeled distinctly.
Let $\mathrm{E}(\mathrm{G})$ be the edge set given for $\mathrm{C}_{2 \mathrm{~m}+1}, \mathrm{E}(\mathrm{G})=\mathrm{U}_{i=1}^{8} \mathrm{E}_{\mathrm{i}}$ where,
$\mathrm{E}_{1}=\left\{\left(v_{4 j-4} v_{4 j-3}\right) ; j=1\right\}$
$\mathrm{E}_{2}=\left\{\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}+1}\right) ; 1 \leq j \leq m-1\right\}$
$\mathrm{E}_{3}=\left\{\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}}\right) ; 1 \leq j \leq m-1\right\}$
$\mathrm{E}_{4}=\left\{\left(v_{4 j-3} v_{4 j-2}\right) ; 1 \leq j \leq m-1\right\}$
$\mathrm{E}_{5}=\left\{\left(v_{4 \mathrm{j}-2} v_{4 \mathrm{j}-1}\right) ; 1 \leq j \leq m-1\right\}$
$\mathrm{E}_{6}=\left\{\left(v_{4 \mathrm{j}-1} v_{4 \mathrm{j}}\right) ; 1 \leq j \leq m-1\right\}$
$\mathrm{E}_{7}=\left\{\left(v_{4 \mathrm{~m}-4} v_{4 \mathrm{~m}-2}\right)\right\}$ and
$\mathrm{E}_{8}=\left\{\left(v_{4 \mathrm{~m}-3} v_{4 \mathrm{~m}-2}\right)\right\}$
Defining the induced edges by the function $f^{*}: \mathrm{E}(\mathrm{G}) \rightarrow \mathrm{N}$,

$$
f *\left(v_{4 j-4} v_{4 j-3}\right)=32 \mathrm{j}^{2}-56 \mathrm{j}+25 ; \mathrm{j}=1
$$

$$
\begin{aligned}
& f *\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}+1}\right)=8(4 \mathrm{j}-1) ; 1 \leq j \leq m-11 \\
& f^{*}\left(v_{4 \mathrm{j}-4} v_{4 \mathrm{j}}\right)=8(4 \mathrm{j}-2) ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-3} v_{4 \mathrm{j}-2}\right)=8 \mathrm{j}-5 ; 1 \leq j \leq m-1 \\
& f^{*}\left(v_{4 \mathrm{j}-2} v_{4 \mathrm{j}-1}\right)=8 \mathrm{j}-3 ; 1 \leq j \leq m-1 \\
& f *\left(v_{4 \mathrm{j}-1} v_{4 \mathrm{j}}\right)=8 \mathrm{j}-1 ; 1 \leq j \leq m-1 \\
& f *\left(v_{4 \mathrm{~m}-4} v_{4 \mathrm{~m}-2}\right)=4(4 \mathrm{~m}-3) \& \\
& f^{*}\left(v_{4 \mathrm{~m}-3} v_{4 \mathrm{~m}-2}\right)=8 \mathrm{~m}-5
\end{aligned}
$$

It is clear that, labeling of the edges are distinct by the induced function. Hence, graph admits the square difference labeling.

Example 8: $\mathrm{C}_{8}$ with (path) $\mathrm{P}_{4}$ chords are parallel, is a square Difference graph, illustrated in Fig 9.

Fig. 9 Cycle $\mathrm{C}_{9}$ with parallel $\mathrm{P}_{4}$ chords

## Conclusion:

Here, we have proposed the certain results, which obtains the labeling on Cycle with Parallel (path) $\mathrm{P}_{4}$ Chord; We have proved that the graphs $C_{2 m}(m \geq 3)$ with Parallel $\mathrm{P}_{4}$ Chord and $C_{2 m+1}(m \geq 3)$ with Parallel (path) $\mathrm{P}_{4}$ Chord permits vertex even mean, vertex odd mean labeling. In addition to this, we also proved results for Square sum and difference labeling.
