#### Abstract

Currently, diabetes is one of the most dangerous diseases spreading among people around the world. The most prominent reasons for the spread of this type of the disease are social, behavioral and medical factors. Different types of diabetes mellitus affecting both men and women were discussed by researchers. Various symptoms caused to the disease was determined by physicians. These symptoms were classified as criteria in this study according to the literature. The paper aims to evaluation preferences of the diabetes symptoms for patients by adapting decision-making techniques. Multiple criteria decision-making techniques were used to solve the decision-making problems in this study. The study methodology consists of three stags; 1) Determine multi criteria of diabetes mellitus symptoms according to the literature; 2) Calculation of parameter weights using triangular fuzzy numbers approach; 3) Selection the best and worst alternative of diabetes patients by applying the fuzzytechnique of order preference similarity to the ideal solution (TOPSIS) method according to the multiple symptoms. Results were obtained from selecting the best patient at (P248), while the worst patient was identified at (P333). Hence, this study may assist patients and doctors in taking appropriate measures aimed at reducing the incidence of diabetes.

Keywords: Diabetes Mellitus Symptoms, Triangular Fuzzy Numbers, TOPSIS, MCDM

## 1. Introduction

Nowadays, diabetes mellitus is a widely spread disease among humans around the world. Diabetes mellitus is a disease that affects all people and all ages' stages that causes variation in blood sugar levels due to a disorder of the glands that secrete insulin in the body [1]. Many symptoms that may increase the rate of diabetes due to lack of exercise and a change in eating habits. These symptoms are currently considered one of the main causes of noncommunicable diseases [2]. Previously, the number of people with diabetes in humans ranged between ages (2079) years, while now even people at an early age have become vulnerable to developing it [3].

The results of the International Diabetes Federation (IDF) reported in the year 2019, there is a potential increase in the number of deaths among adults and elderly people with diabetes mellitus between the ages of 65 and 99 . In addition to the increased mortality among adults with diabetes aged 20 to 79 years. As well as, global estimates predict the incidence, increasing of deaths with type- 1 diabetes in children and adolescents and the prevalence of hyperglycemia during pregnancy in 2019 and beyond [3].

According to the Annual reports of the World Health Organization (WHO), about 422 million people are infected by diabetes mellitus around the world. The majority of people with this disease live in low- and middleincome regions. In addition, the death rate from diabetes has reached 1.6 million deaths annually. Consequently, the incidence of diabetes has steadily increased over the past few decades [4].

Several approaches have presented to identify the symptoms which causing diabetes among people. Some studies have provided solutions to the problem of diagnosing diabetes symptoms using artificial intelligence techniques. The process of determining symptoms of diabetes Mellitus in its early stages is important for disease control. A new approach to the early diagnosis of disease using a fuzzy inference system has been proposed. In addition to diagnosing symptoms, this system also provides recommendations for treatment [5]. The F-Score feature selection is utilized with the Fuzzy Support Vector Machine (FSVM) method for the dataset to classify and detect diabetes mellitus. The dataset is trained using the SVM method to generate fuzzy rules and applying the fuzzy inference process to classify the outputs for diabetic patients [6]. A new approach proposed to determine the risk factors of the diabetes mellitus using range dominate fuzzy prediction (RDFP) method for diagnosing the disease in its early stages. The ranking of outputs using the proposed RDFB method to identify the high and low the risk levels of patients by diabetes and assist clinicians to diagnose the disease [7]. Risk factors causing some complications for diabetic patients were identified by integrating the fuzzy system with two multi-criteria decision
methods. Fuzzy TOPSIS method and fuzzy Grey Relational Analysis (GRA) method used to determine diabetes complications [8].

The paper organized following as section 1, the introduction discusses the diabetes mellitus risk. Section 2, discuss the methodology proposed to solve diabetes mellitus symptoms problem. Section 3, discussion of the results. Section 4, conclusion.

## 2. Overview of Diabetes Mellitus

There are three main types of diabetes mellitus spread around the world. Diabetes is a disease that indicates the level of glucose in the human body. Glucose is the main source of energy that the cells of the body need. Level of glucose is maintained by insulin which is secreted by the pancreas. Therefore, to maintain the level of glucose in the body, the level of insulin secreted by the pancreas is determined [5], [7],[8], [9].

The most important types of diabetes Mellitus:

1. Type 1 Diabetes (T1D): Often the pancreas produces little amount of insulin required for body or no insulin developed type -1 diabetes (insulin-dependent)
2. Type 2 diabetes (T2D): the body often does not use insulin, developed type 2 diabetes (insulin-independent)
3. Gestational Diabetes: Pregnant women often get this type of diabetes during pregnancy period.

## 3. Materials and Methods

This section discusses the proposed methodology for solving the diabetes mellitus risk problem using multicriteria decision-making methods. Many research has adopted these methods to solve the problem of conflict of criteria with different such as healthcare, education, and industry sectors [10],[11],[12]. This methodology using a triangular fuzzy number approach to evaluate several of diabetes mellitus symptoms. As well as, using a fuzzyTOPSIS method to select between patients of diabetes mellitus based on different symptoms. The methodology applied in three stages: the first stage, eight criteria determined different symptoms as age, pregnancies, glucose blood pressure, skin thickness, insulin, body mass index, and diabetes pedigree function obtained from large scale data [13]. The second stage, adapting the triangular fuzzy number approach to evaluate eight criteria based on the decision-maker. Finally, the best and worst alternatives selected using the fuzzy-TOPSIS method according to the 768 patients. MCDM techniques are adopted to solve decision-making problems for diabetes mellitus symptoms in this study. See figure 1, illustrated proposed framework for selection diabetes mellitus alternatives.

Figure. 1 proposed framework for selection diabetes mellitus alternatives

### 3.1 Triangular Fuzzy Number

L.Zadeh [14] proposed a fuzzy set theory or probability theory based on the concept of probability distribution as ambiguous variables. This theory based on flexible vague constraints of values that can be assigned to a particular variable. The fuzzy logic theory was applied in different studies to solve different issues as in the industry, health care and education sectors [15],[16].
A triangular fuzzy number included three elements $\widetilde{\boldsymbol{a}}=\left(\boldsymbol{a}^{\boldsymbol{l}}, \boldsymbol{a}^{\boldsymbol{m}}, \boldsymbol{a}^{\boldsymbol{u}}\right)$ as a membership function can be defined as follows: [17], ,[18].

Triangular Fuzzy Numbers $\widetilde{\boldsymbol{a}}=\left(\boldsymbol{a}^{l}, \boldsymbol{a}^{m}, \boldsymbol{a}^{u}\right)$

$$
\mu \tilde{a}(\mathrm{x})=\left\{\begin{array}{l}
\left(x-a_{l}\right) /\left(a_{m}-a_{l}\right) \text { if } a_{l} \leq x \leq a_{m}  \tag{1}\\
\left(a_{u}-x\right) /\left(a_{u}-a_{m}\right) \text { if } a_{m} \leq x \leq a_{u} \\
0, \quad \text { Otherwise. }
\end{array}\right.
$$

Figure. 2 triangular fuzzy number procedure
The triangular fuzzy number represented as triple values as in the figure 2.
Where, the $a^{l}$ represent a lower number, $a^{m}$ represent a moderate number and $a^{u}$ represent an upper number then $a^{l} \leq a^{m} \leq a^{u}$, and if the $a^{l}=a^{m}=a^{u}$ after that the $\tilde{a}$ could be a crisp number.
Fuzzy values are represented in two matrix using triangular fuzzy numbers as $\tilde{a}=\left(a^{l}, a^{m}, a^{u}\right)$ and $\tilde{b}=$ $\left(b^{l}, b^{m}, b^{u}\right)$
where $\tilde{a}>0$ and $\tilde{b}>0$ which implemented in different arithmetic formulas as following:[8], [19]
1- Addition formula:

$$
\begin{equation*}
\tilde{a}+\tilde{b}=\left(a^{l}+b^{l}, a^{m}+b^{m}, a^{u}+b^{u}\right) \tag{2}
\end{equation*}
$$

2- Subtraction formula:

$$
\begin{equation*}
\tilde{a}-\tilde{b}=\left(a^{l}-b^{l}, a^{m}-b^{m}, a^{u}-b^{u}\right) \tag{3}
\end{equation*}
$$

3- Multiplication formula:

$$
\begin{equation*}
\tilde{a} * \tilde{b}=\left(a^{l} * b^{l}, a^{m} * b^{m}, a^{u} * b^{u}\right) \tag{4}
\end{equation*}
$$

4- Division formula: $\tilde{a} / \tilde{b}=\left(a^{l} / b^{U}, a^{m} / b^{m}, a^{u} / b^{I}\right)$

5- Inverse

$$
\begin{equation*}
\frac{1}{\tilde{a}}=\frac{1}{\left(a^{l}+a^{m},+a^{u}\right)}=\left(\frac{1}{a^{l}}+\frac{1}{a^{m}}+\frac{1}{a^{u}}\right) \tag{6}
\end{equation*}
$$

The triangular fuzzy numbers $\tilde{A}=\left(a^{l}, a^{m}, a^{u}\right)$ this matrix included a triples elements as follows:
$\tilde{A}=\left[\begin{array}{ccc}a_{11}^{l}, a_{11}^{m}, a_{11}^{u} & \cdots & a_{1 n}^{l}, a_{1 n}^{m}, a_{1 n}^{u} \\ \vdots & \ddots & \vdots \\ a_{m 1}^{l}, a_{m 1}^{m}, a_{m 1}^{u} & \cdots & a_{m n}^{l}, a_{m n}^{m}, a_{m n}^{u}\end{array}\right]$
Let the matrix $\tilde{A}$ be an $(\mathrm{m} \times \mathrm{n})$ represented in triangular fuzzy elements. This matrix can be a reciprocal form when the condition is satisfied:
$\tilde{a}_{i j}=\left(a_{i j}^{l}, a_{i j}^{m}, a_{i j}^{u}\right)$
$\tilde{a}_{i j}=\left(\frac{1}{a_{i j}^{l}}, \frac{1}{a_{i j}^{m}}, \frac{1}{a_{i j}^{u}}\right)$
where the $i, j=1,2, \ldots \ldots, \mathrm{n}$

$$
\tilde{A}=\left[\begin{array}{ccc}
(1,1,1) & \left(a_{i j}^{l}, a_{i j}^{m}, a_{i j}^{u}\right) \cdots & \left(a_{i j}^{l}, a_{i j}^{m}, a_{i j}^{u}\right)  \tag{11}\\
\left(\frac{1}{a_{i j}^{l}}, \frac{1}{a_{i j}^{m}}, \frac{1}{a_{i j}^{u}}\right): & (1,1,1) \ddots & \left(a_{i j}^{l}, a_{i j}^{m}, a_{i j}^{u}\right): \\
\left(\frac{1}{a_{i j}^{l}}, \frac{1}{a_{i j}^{m}}, \frac{1}{a_{i j}^{u}}\right) & \left(\frac{1}{a_{i j}^{l}}, \frac{1}{a_{i j}^{m}}, \frac{1}{a_{i j}^{u}}\right) \cdots & (1,1,1)
\end{array}\right]
$$

Where $0<a_{i j}^{l}<a_{i j}^{m}<a_{i j}^{u}, i, j=1,2, \ldots ., \mathrm{n}$.

Table. 1. Triangular fuzzy number

| Description of scales | Triangular Fuzzy number |
| :--- | :---: |
| Equal favors | $(1,1,1)$ |
| Slightly favors | $(2,3,4)$ |
| Strong favors | $(4,5,6)$ |
| Very strong favors | $(6,7,8)$ |
| Extremely favors | $(9,9,9)$ |

The linguistic values of this matrix converted to the triangular fuzzy numbers.

Av: Age value
$P$ v: Pregnancies value
$\mathrm{G} v$ : Glucose value
B.P v: Blood Pressure value
S.T v: Skin Thickness value

I v: Insulin value
B.M.I v: BMI value
D.P.F v: Diabetes Pedigree Function

### 3.2 Fuzzy-TOPSIS method

The Fuzzy- TOPSIS method is applied, which considered a proper method established by Hwang and Yoon in 1981. In addition, other improvements were made by Yoon in 1987[20],[21]. In this method, the correct selection is chosen based on calculating the geometric mean of the positive ideal order and calculating the largest geometric separation for the negative ideal order [22].

Step 1: Fuzzy TOPSIS can be briefly expressed in the matrix using Eqs.(12) and (13) [23],[19].

$\tilde{D}=$|  |
| :---: |
| $A 1$ |
| $A 2$ |
| $A 3$ |
| $\ldots$. |
| $A m$ |\(\left[\begin{array}{cccc}C 1 \& C 2 \& ··· ··· . \& C n <br>

\tilde{x} 11 \& \tilde{x} 12 \& ··· ··· . \& \tilde{x} 1 \mathrm{n} <br>
\tilde{x} 21 \& \tilde{x} 22 \& ··· ··· \& \tilde{x} 2 \mathrm{n} <br>
\tilde{x} 31 \& \tilde{x} 32 \& ··· ··· \& \tilde{x} 3 \mathrm{n} <br>
\tilde{x} m 1 \& \vdots \& \ddots \& <br>
\& \tilde{x} m 2 \& ··· ··· \& \tilde{x} m \mathrm{mn}\end{array}\right]\)
$\widetilde{W}=[\widetilde{w} 1, \widetilde{w} 2, \widetilde{w} 3, \ldots ., \widetilde{w} n]$
Where $\tilde{x} i j, \mathrm{i}=1,2, \ldots, \mathrm{~m}, \mathrm{j}=1,2, \ldots, \mathrm{n}$ and $\widetilde{w} j, \mathrm{j}=1,2, \ldots, \mathrm{n}$ are linguistic triangular fuzzy numbers, $\tilde{x} i j=\left(l_{i j}\right.$, $m_{i j}, u_{i j}$ ).

Step2: Representing a normalized fuzzy decision matrix namely $\tilde{R}$ is formulated as in Eq (14).
$\tilde{R}=[\tilde{x} i j](m \times n)$
Step3: Selection the linguistic Triangular fuzzy number ratings, $\tilde{x} i j, i=1,2, \ldots, m, j=1,2, \ldots, n$ used for alternatives based on criteria and the appropriate linguistic variables, as well as the $\widetilde{w} j, j=1,2, \ldots, n$ for criteria weight.

Step4: Creation the weighted fuzzy normalized of the decision matrix. The weighted fuzzy normalized value represented in the DM using Eq. (15).
$\tilde{V}=\left[\begin{array}{ccccc}\widetilde{w} 1 \tilde{r} 11 & \widetilde{w} 2 \tilde{r} 12 & \ldots . & \widetilde{w} j \tilde{r} 1 j \ldots \ldots & \widetilde{w} 1 \tilde{r} 1 n \\ \widetilde{w} 2 \tilde{r} 21 & \widetilde{w} 2 \tilde{r} 22 & \ldots . & \widetilde{w} j \tilde{r} 2 j & \ldots . \\ \vdots & \vdots & \widetilde{w} 2 \tilde{r} 2 n \\ \widetilde{w} 1 \tilde{r} i 1 & \widetilde{w} 2 \tilde{r} i 2 & \ldots . . & \widetilde{w} j \tilde{r} i 2 & \ldots . \\ \vdots & \vdots & \widetilde{w} 2 \tilde{r} i n \\ \widetilde{w} 1 \tilde{r} m 1 & \widetilde{w} 2 \tilde{r} m 2 & \ldots . . \widetilde{w} j \tilde{r} m j \ldots . & \widetilde{w} j \tilde{r} m n\end{array}\right]$

Step5: Calculation triangular fuzzy- positive-ideal solution (FPIS, A*) and the triangular fuzzy- negative-ideal solution (FNIS, $A^{-}$) represented in Eqs. (16) and (17).

$$
\begin{align*}
A^{*} & =\left(\tilde{v}_{1}^{*}, \tilde{v}_{2}^{*}, \ldots, \tilde{v}_{n}^{*}\right) \\
& =\left\{\left(\max _{i} v_{i j} \mid i=1,2, \ldots, m\right), j=1,2, \ldots, \mathrm{n}\right\}  \tag{16}\\
A^{-} & =\left(\tilde{v}_{1}^{-}, \tilde{v}_{2}^{-}, \ldots, \tilde{v}_{n}^{-}\right) \\
& =\left\{\left(\min _{i} v_{i j} \mid i=1,2, \ldots, m\right), j=1,2, \ldots, \mathrm{n}\right\} \tag{17}
\end{align*}
$$

Step6: Calculation of separation scale. Calculating the distance for each alternative based (A* and A-) measure using Eqs. (18) and (19).
$d_{i}^{*}=\sum_{j=1}^{n} d\left(\tilde{v}_{i j}^{*}, v_{j}^{*}\right), i=1,2, \ldots, m$
$d_{i}^{-}=\sum_{j=1}^{n} d\left(\tilde{v}_{i j}^{-}, v_{j}^{-}\right), i=1,2, \ldots, m$
Step7: Calculation of closeness coefficient and similarity to the ideal solution. This step applied for calculating the closeness coefficient and similarity to an ideal solution using Eq. (20):
$C C_{i}=\frac{d_{i}^{-}}{d_{i}^{-}+d_{i}^{*}}$
Step 6: Calculation of the ranking of alternatives. This step applied to select an alternative based on the maximum $C C_{i}^{*}$ or calculating the ranking of alternatives using $C C_{i}^{*}$ in descending order.

## 4. Results and Discussion

In this section, the results of this study were obtained by combining the fuzzy system with the TOPSIS method. The triangular fuzzy numbers applied to calculate the weights of the criteria in the case study. Table 3, shows the conversion of linguistic values into triangular fuzzy numbers. As well as, table 4 , illustrate the calculation of weights for the values of the criteria that were determined based on the opinions of three experts according to the formula
of the triangular fuzzy numbers. In order to obtain single values for each criterion, the triangular fuzzy numbers0 values are collected according to the opinion of the experts, as shown in Table 5. Hence, the weights of the criteria which selected will be used with the normalization data using TOPSIS technique in the next section.
Table. 3. Linguistic triangular fuzzy number

| Description Score | Score | Triangular Fuzzy Number |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Extremely low | EL | 0 | 0 | 0.1 |
| Very low | VL | 0 | 0.1 | 0.3 |

Table. 5. Aggregated triangular fuzzy decision matrix

| Criteria | DM1 | DM2 |  | DM3 |
| :--- | :---: | :---: | :---: | :---: |
| Age | 0.37 | 0.57 |  | 0.73 |
| Pregnancies | 0.50 | 0.67 |  | 0.80 |
| Glucose | 0.30 | 0.50 |  | 0.67 |
| Blood Pressure | 0.50 | 0.70 |  | 0.83 |
| Skin Thickness | 0.27 | 0.43 |  | 0.60 |
| Insulin | 0.50 | 0.70 |  | 0.83 |
| BMI | 0.37 | 0.57 |  | 0.77 |
| Diabetes <br> Pedigree <br> Function | 0.30 | 0.50 |  | 0.70 |

In other hand, final results were obtained after applying the fuzzy TOPSIS method. The dataset was adapted for various patients with diabetes mellitus. The normalization values of the data were calculated according to formula 14 , based on the appropriate linguistic variables. Table 6 , shows the normalization values for the data set values based on the triangular fuzzy numbers. The weights of the criteria were calculated based on the triangular fuzzy numbers, which used with the normalization values of the data as in formula 15. Therefore, table 7, shows the weighted normalization values for the various criteria in this study. In another hand, the values of the positive ideal solution (FPIS), as well as the values of the negative ideal solution (FNIS), are determined according to the formulas $(16,17)$ respectively. In addition, distance values for each alternative are calculated based on the positive and
negative ideal solution values previously obtained using the formulas $(18,19)$. As well as, the closeness coefficient and similarity to the ideal solution are calculated based on the formula (20). Finally, the ranking of all alternatives is calculated according to the maximum $C C_{i}^{*}$ or calculating the ranking of alternatives using $C C_{i}^{*}$ in descending order. The results showed the best alternative for the patient (P248), while the worst for the patient (P333) were developing to the debates Mellitus.

## 5. Conclusion

Since diabetes mellitus has become widespread among humans is become a necessity to determine the symptoms that lead to this disease. Early diagnosis of these symptoms may help people with diabetes mellitus to reduce the likelihood of developing it. In this paper, a new framework for evaluating symptoms of diabetes is proposed. An innovative methodology was adopted in evaluating the various criteria based on the triangular fuzzy numbers approach. As well, the Fuzzy-TOPSIS method is applied to select the best and worst-case among the group of patients with this disease based on different criteria. This framework helps people identify the most important symptoms of diabetes and how to prevent it. The results show the best case at (P 248), and the worstcase at (P333) from the group of patients with diabetes mellitus. In future works, this framework could be applied with further symptoms or other diseases to help both people and physicians. Thus, we recommend to people should be monitoring these symptoms in their lives on a daily basis to prevent infection with this disease, and this is important to enjoy in good health.

## Akenwlogment

The authors appreciate the support of the Spatial Research Unit (SRU)at the University of Diyala for this major research project, as well as some friends who provided their valuable advice to improve the quality of the research.
